

Reduce business risk and increase competitive advantage through accelerated access to key documents. Vestigate is a game-changing application for conducting document review.

Vestigate is a document review solution that provides legal professionals with the ability to rapidly and accurately identify relevant documents in collections. It is perfectly suited for teams involved in:

- Litigation
- HSR Second Requests
- Corporate Investigations
- Regulatory Inquiries
- Compliance Audits

RenewData developed Vestigate as a human-based decision-making review application that accelerates access to key documents, provides measurable accuracy to ensure that relevant documents have not been missed and significantly reduces project cost and time. The net result is a reduction in business risk and increased competitive advantage.

Today the cost of document review is one of the largest single components of the litigation budget. Corporations are faced with ever increasing volumes of data while the amended Federal Rules of Civil Procedures (FRCP) also require better control over discovery obligations. The Vestigate document review platform allows legal teams to rapidly and accurately analyze electronically stored information (ESI) for early case assessment or full relevancy review purposes.

Traditional approaches to document review are expensive, tough to scale, inaccurate and have results that are difficult to explain. Whether relying on keyword searching, artificial intelligence clustering or armies of document reviewers, studies have shown each of these solutions to be fraught with problems. Vestigate addresses each of these weaknesses. Real world, high-stakes litigation has demonstrated this process to be the most effective approach to identifying relevant documents, while significantly reducing cost by up to 50% and making review as much as 10 times faster.

BENEFITS OF VESTIGATE

This rapid assessment tool allows you to mitigate your risk. Clients realize significant and measurable value using Vestigate:

- 50% savings over traditional document review strategies.
- 70% reduction in the length of time to conduct review.
- 99.9% certainty that reviewers have not missed relevant documents.
- Human reviewers make all coding decisions.
- Ease of use and minimal training required to enable rapid start-up.
- Eliminates the need to “go-back” through reviewed documents when a new issue is introduced or new information is learned about the case.
- Eliminates the armies of reviewers in exchange for a handful of staff, regardless of the size of the document collection.
- Eliminates the inconsistencies associated with human behavior during document-intensive reviews.
- Detailed and easily generated reporting capabilities.
- Complimentary to and easily integrated with other eDiscovery analysis and production tools.

MEASURABLE CERTAINTY - 99.9% CERTAINTY REVIEWERS HAVE NOT MISSED RELEVANT DOCUMENTS

Vestigate is a scientific workflow breakthrough and not a “black box” technology that relies on artificial intelligence. Accuracy is judged using universally accepted and adjudicated statistical quality assurance testing that provides case teams with 99.9% certainty that all relevant documents have been identified during review. This combination of sound workflow, defensible mathematical techniques and breakthrough technology results in document reviews that are fast, measurably accurate and cost effective.

REDUCE REVIEW COST - 50% OR MORE SAVINGS OVER TRADITIONAL REVIEW METHODS

Vestigate eliminates huge labor costs through dramatic reductions in staffing requirements. A review consisting of 500,000 documents can be accomplished in Vestigate with only six (6) reviewers in about 30 days. This is a reduction of 30-40 reviewers resulting in dramatic cost savings. And best of all, when the review is finished, the team will know with 99.9% independently verifiable certainty that every relevant document was found. Something armies of expensive labor can't come close to claiming.

INCREASE SPEED - 70% REDUCTION IN THE TIME TO CONDUCT REVIEW

Vestigate review is generally completed after reading only 10-15 percent of a document collection resulting in a significant reduction in the length of time required. It is a process that leverages what humans identify as relevant on one document to tag multiple documents. While only a minority of the collection is actually read, every document is subject to consideration via searches and the randomized presentation of documents to the reviewers. A process that dramatically speeds up review.
